## Topic 10:

Integers

Integers - CSc 144 v1.0 (McCann) - p. 1/20

### Background

In this topic we'll learn/review more properties of integer values.

We already know at least two ways in which to categorize integers:

# **Prime Numbers Definition: Factor Definition: Prime Definition: Composite Example(s):** Integers - CSc 144 v1.0 (McCann) - p. 3/20 From the 'Is This a Great Name or What?' Dept. **Theorem: (The Fundamental Theorem of Arithmetic)** If p is a positive integer $\geq 2$ , p is prime or can be expressed as the product of multiple primes. **Example(s): Definition: Prime Factorization**

## Another Prime/Composite Theorem (1 / 2)

Theorem: If $n$ is composite, $n$ has at least one prime	
factor no larger than $\sqrt{n}$ .	
Integers – CSc 144 v1.0 (McCan	n) – p. 5/20
Another Prime/Composite Theorem (2 / 2)

Useful detail: If $c \mid (a+b)$ and $c \mid a$ , then $c \mid b$ .

#### Mersenne Numbers (1 / 2)

- The  $n^{th}$  Mersenne Number is  $2^n-1$  (1, 3, 7, 15, ...).
- If n is composite,  $2^n 1$  can't be prime.
  - Why not? As n=ab,  $2^n-1=2^{ab}-1$ , which is a binomial number and so it has  $2^a-1$  as a factor.
- ullet If n is prime,  $2^n-1$  might be prime. ( $2^{11}-1=23\cdot 89$ )
  - o If so, it's called a Mersenne Prime.
  - Only a few dozen such primes have been found.

So ... what's the big deal?

Integers - CSc 144 v1.0 (McCann) - p. 9/20

#### Mersenne Numbers (2 / 2)

- There exist efficient tests for the primality of Mersenne numbers (e.g., the Lucas-Lehmer test).
- The GIMPS project uses spare CPU cycles to find Mersenne primes.

#### Least Common Multiple (LCM) (1 / 2)

Definiti	ion: L	east	Comi	mon	Mult	iple					
							• •	 	 	 	
Examp	le(s):										

Integers - CSc 144 v1.0 (McCann) - p. 15/20

#### Least Common Multiple (LCM) (2 / 2)

#### **Example(s):**

At your house, the garbage is collected once a week, a new five gallon bottle of water is delivered every 10 days, and your spouse insists that you vacuum the living room every five days. Yesterday, all three occurred on the same day. How often does that happen?

#### **Another Theorem!**

Theorem: If  $a,b \in \mathbb{Z}^+$ , then  $ab = gcd(a,b) \cdot lcm(a,b)$ .

Proof (direct): Consider the prime factorizations of a and b. The LCM is the product of the terms with the larger exponents and all terms that aren't shared. The GCD is the product of the remaining terms. Thus, the product of the LCM and GCD terms is the product of all terms in the prime factorizations.

Therefore, if  $a, b \in \mathbb{Z}^+$ , then  $ab = gcd(a, b) \cdot lcm(a, b)$ .

Integers - CSc 144 v1.0 (McCann) - p. 17/20

#### Congruences (1/3)

It is pitch black. You are likely to be eaten by a ...

#### Congruences (2/3)

(Review from Topic 1.)

#### **Definition: Congruent Modulo** m

If  $a,b\in\mathbb{Z}$  and  $m\in\mathbb{Z}^+$ , then a and b are congruent  $modulo\ m$  (written  $a\equiv b\ (\mathrm{mod}\ m)$ ) iff  $a\ \%\ m=b\ \%\ m$  (or, iff  $m\ |\ (a-b)$ ).

# Example(s):

Integers - CSc 144 v1.0 (McCann) - p. 19/20

#### Congruences (3 / 3)
