

# Topic 10:

---

## Transactions and Assertions

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 1/17

## What is a Transaction?

---

The situation:

Individual SQL statements are often pieces of multi-step actions that a DBMS must manage.

### Definition: Transaction

<p>.....</p> <p>.....</p>
---------------------------

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 2/17

# The ACID Properties of Transactions

---

**A** is for \_\_\_\_\_ :

**C** is for \_\_\_\_\_ :

**I** is for \_\_\_\_\_ :

**D** is for \_\_\_\_\_ :

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 3/17

## Transaction Lifetime (1 / 2)

---

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 4/17

## Transaction Lifetime (2 / 2)

---

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 5/17

## Transaction Isolation

---

Observation: In Oracle's PL/SQL, every action is automatically part of a transaction.

To stop a transaction (and start a new one), either:

To make each PL/SQL statement its own transaction:

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 6/17

# Transaction Isolation Demo (1 / 2)

---

Each 'user' is an Oracle login in a separate terminal window:

User 1	User 2
(1) @ xact.sql	—
(2) show autocommit; ⇒ "autocommit OFF"	—
(3) select * from score;	—
(4) —	select * from score; ⇒ no rows are selected
(5) —	select table_name from user_tables; ⇒ yes, score exists!
(6) commit;	—
(7) —	select * from score; ⇒ score's content is visible

(Continues ...)

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 7/17

# Transaction Isolation Demo (2 / 2)

---

User 1	User 2
(8) insert into score values (5,460,'B');	—
(9) select * from score; ⇒ shows it	—
(10) —	select * from score; ⇒ <u>doesn't</u> show it
(11) rollback;	—
(12) select * from score; ⇒ like it was never there	—
(13) set autocommit on;	—
(14) insert into score values (4,453,'B');	—
(15) —	select * from score; ⇒ shows it

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 8/17

# Constraints in SQL

---

Consider:

```
create table applicant (  
    id      integer,  
    email char(30) not null,  
    ...  
    primary key (id)  
);
```

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 9/17

## Assertions (1 / 2)

---

The SQL standard provides for general assertions.

**Example(s):** No one in 460 can receive an 'E':

```
create assertion no_460_Es  
check (not exists (select *  
                    from score  
                    where course = 460  
                    and grade = 'E') );
```

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 10/17

## Assertions (2 / 2)

---

... Oracle supports a form of general constraint within 'create table':

**Example(s):** No one in 460 can receive an 'E':

```
create table score (  
    ...  
    constraint no_fail check (grade <> 'E')  
);
```

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 11/17

## Trigger Basics (1 / 2)

---

- Triggers support the idea of 'active databases' (events initiate predetermined actions)
- Oracle does support these (stay tuned!)
- Triggers follow the "ECA" model:
  - 
  - 
  -
- Useful for input validation and update logging tasks

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 12/17

## Trigger Basics (2 / 2)

---

Some Disadvantages of Triggers:

1. Hard to write the appropriate actions
2. Specified separately from relations(s)
3. Can reduce the DBMS' concurrency
4. Generally hard to anticipate how the triggers will interact

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 13/17

## Triggers in Oracle (1 / 4)

---

Oracle's basic trigger definition syntax:

```
create trigger <name>
{before/after} {insert/delete/update of <attr>} on <relation>
[ [ for each row ] when ( < condition > ) ]
< PL/SQL block > ;
```

Component meanings:

- “**for each row**” gives row-level triggers (vs. statement-level):
  - “row-level”: trigger executes when a row is changed
    - ‘**before**’ – fires before a new value is written
    - ‘**after**’ – fires after value is written; good for validation
  - “stmt-level”: trigger executed when SQL statement is executed
- The PL/SQL block can be a compound statement
- Only use triggers when necessary – execution order not guaranteed!

Transactions and Assertions – CSc 460 v1.1 (McCann) – p. 14/17

## Triggers in Oracle (2 / 4)

---

Oracle's Create Trigger command does only that — creates.

To activate the trigger, follow it with either:

- (a) `.`            ← (period) terminates subprogram creation
- `run;`        ← execute PL/SQL subprogram
- (b) `/`            ← (slash) merges `[.]` and `[run;]`

## Triggers in Oracle (3 / 4)

---

We want to know if someone tries to add a 460 'E' in score:

### Example(s):

```
create trigger no_460_Es
after insert on score
for each row
when ( new.course = 460 and new.grade = 'E' )
begin
  raise_application_error (-20000, 'message');
end no_460_Es;
/
```

# Triggers in Oracle (4 / 4)

---

## Notes:

1. Could we use a trigger to change an inserted 'E' to a 'D'?
  - No. We can't change the table that triggered the rule currently being executed. Oracle will report a "mutating table" error.
2. It's easy to create syntax errors when writing triggers
  - Use `sho err` to see the last compilation error
3. Removing a trigger is easy
  - Use `drop trigger <name>;`
